Maximizing the number of orders per minute (OPM) your servers handle could translate to less waiting for customers retrieving product descriptions, adding items to their carts, and making online purchases.

The ability to support more OLTP (online transaction processing) transactions can speed updating patient records, gathering financial data, and catering to clients' needs. When combined with higher VM density, companies could also see lower expenses related to data center power and cooling.

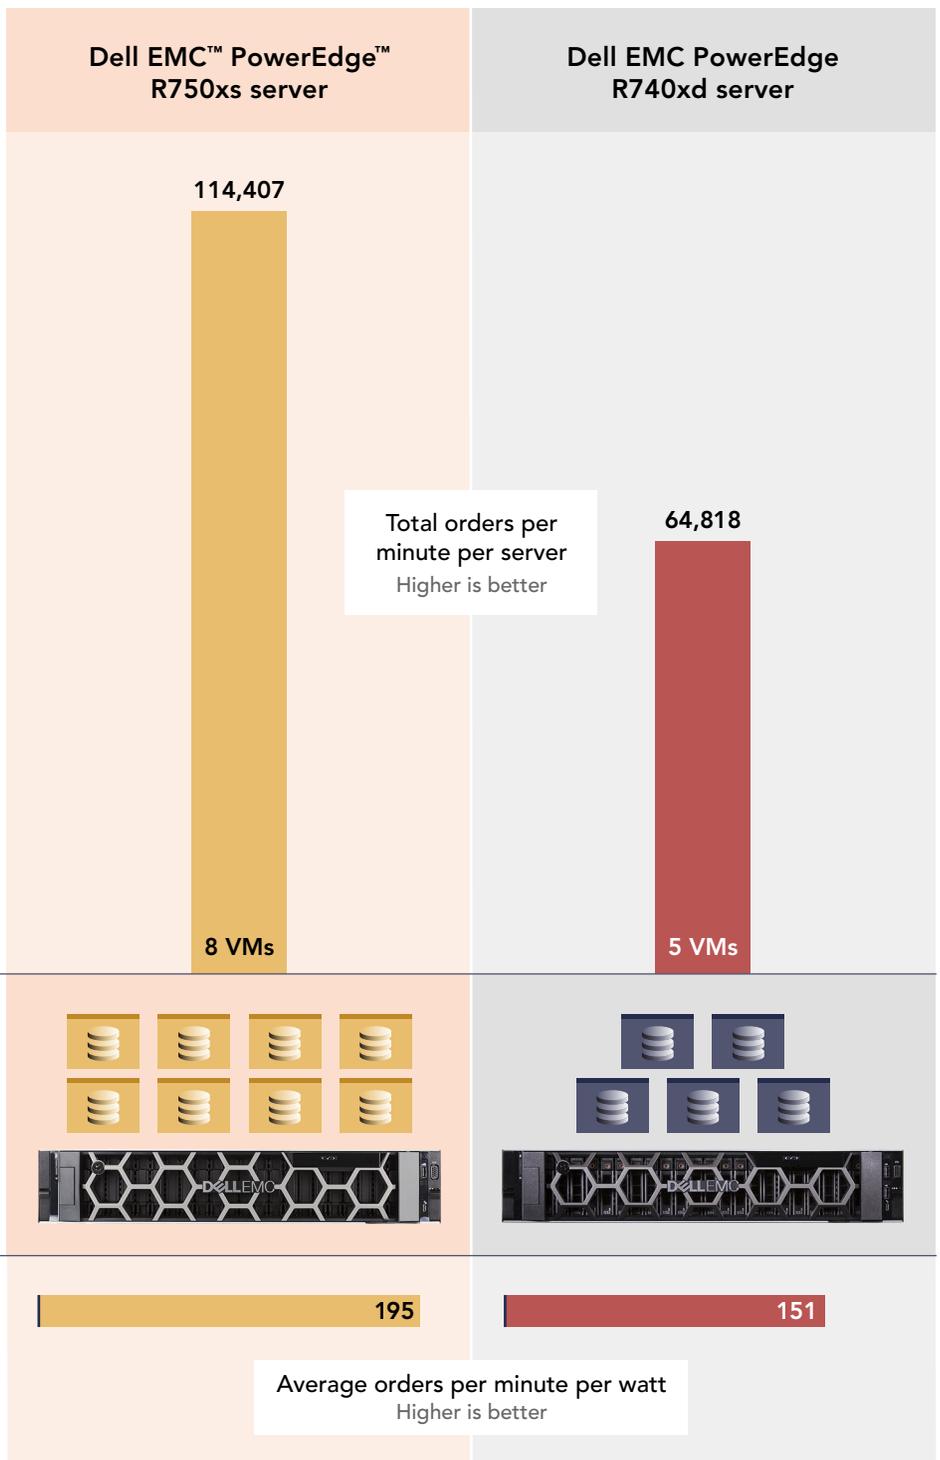

Process 76% more OPM per server

Achieve 37% higher VM density

Handle 22% more OPM per watt

In addition to these performance advantages, the Dell EMC PowerEdge R750xs server supports the latest-generation processor, memory, networking, storage, and security technologies.
